NOTIFICATION OF TRANSMITTAL OF THE INTERNATIONAL PRELIMINARY EXAMINATION REPORT

(PCT Rule 71.1)

IMPORTANT NOTIFICATION

Date of mailing

(day/month/year)

23.11.2004

Applicant's or agent's file reference

International application No.

PCT/EP 03/50265

PF020079

International filing date (day/month/year)

25.06.2003

Priority date (day/month/year)

27.06.2002

Applicant

THOMSON LICENSING SA ET AL.

- The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

EXAMINATION REPORT - SEPARATE SHEET

FROM-EPO SISO3 ELECTRONICS & AUDIO-VIDEO

Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Reference is made to the following documents:

D1: EP-A-1 037 145 (HEWLETT PACKARD CO) 20 September 2000 (2000-09-20)

D2: EP-A-0 949 816 (THOMSON CONSUMER ELECTRONICS) 13 October 1999

(1999-10-13)

D3: US-A-5 768 593 (BROWN JORG ANTHONY ET AL) 16 June 1998 (1998-06-16)

- 1. The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of independent claim 1 does not involve an inventive step in the sense of Article 33(3) PCT.
- 1.1 Document D1 discloses (the references in parentheses applying to this document): a programmable data processing device (10) comprising a loading engine (paragraphs [0010], [0021], figure 1) suitable for receiving portions of code of a first type and/or data from a stream of a broadcast network in which said portions are repeatedly transmitted, a storage means (paragraph [0010]) for storing the portions received by the loading engine, an execution engine (12, 50) for executing an application embodied by the received portions (claim 1, paragraphs [0021]-[0026]), a translating engine (54) for translating the first type code into a native code of the execution engine (claim 1, paragraphs [0025], [0026]), wherein the translating engine is adapted to compile at least a certain one of said received portions into native code, these portions being selected by a control information (paragraphs [0010], [0013], [0023]-[0026]), to store the thus compiled portion in the storage means and to interpret other portions of code, and wherein the execution engine is adapted to process compiled code and interpreted code within a same application (paragraphs [0006], [0007], [0013], [0014], [0021]-[0026]).

The subject-matter of claim 1 therefore differs from this known document D1 in that: the portions to be compiled are selected by a control information received from the stream from which the portions of code of a first type and/or data are received in the loading engine.

The problem to be solved by the present invention may therefore be regarded as how to allow the code developer to specify which portions of the code are to be compiled

(see description, page 5 lines 19,20 and lines 31-35).

FROM-EPO SISO3 ELECTRONICS & AUDIO-VIDEO

The solution proposed in claim 1 of the present application cannot be considered as involving an inventive step (Article 33(3) PCT) for the following reasons:

Document D2 teaches that special signals for controlling the execution of an application can be sent along with the application code (paragraph [0001], column 1 lines 13-23, paragraph [0006]). Departing from D1 and confronted with the problem above, the skilled person would, based on the teachings of D2, consider sending some control information specifying which portions of the code are to be compiled along with the application code, thereby arriving at the solution proposed in claim 1.

Therefore the subject-matter of claim 1 does not involve an inventive step.

1.2 It is also possible to demonstrate the lack of inventive step of claim 1 using document D3, as follows:

Document D3 discloses (the references in parentheses applying to this document): a programmable data processing device (100) comprising a loading engine (figure 1) suitable for receiving portions of code of a first type and/or data from a stream of a broadcast network in which said portions are repeatedly transmitted, a storage means (118) suitable for storing the portions received by the loading engine (column 3 lines 38 and 39, column 6 lines 28 and 29), an execution engine (figure 1) for executing an application embodied by the received portions, a translating engine (114,116) for translating the first type code into a native code of the execution engine (column 3 lines 35-44), wherein the translating engine is adapted to compile at least a certain one of said received portions into native code (column 3 lines 40 and 41, column 3 line 54 column 4 line 19, column 7 lines 16-64), to store the thus compiled portion in the storage means (column 3 lines 38 and 39, column 6 lines 28 and 29) and to interpret other portions of code, which have been predefined to be interpreted (column 3 lines 41-44, column 3 line 54 - column 4 line 19, column 7 lines 16-64), and wherein the execution engine is adapted to process compiled code and interpreted code within a same application (column 3 line 35 - column 4 line 3).

Since D3 discloses a predefined set of instructions to be interpreted, there is control information attached to the code, hence to the stream containing the code, to identify which portions are to be interpreted.

INTERNATIONAL PRELIMINARY

International application No.

PCT/EP 03/50265

EXAMINATION REPORT - SEPARATE SHEET

FROM-EPO SISO3 ELECTRONICS & AUDIO-VIDEO

The subject-matter of claim 1 therefore only differs from this document D3 in that: the control information selects the portions to be compiled, not the ones to be interpreted. This is a mere alternative to the solution disclosed in D3 for solving the problem of how to indicate whether a portion of code is to be interpreted or compiled.

As a consequence, the subject-matter of claim 1 does not involve an inventive step.

- 2. The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of independent claim 10 does not involve an inventive step in the sense of Article 33(3) PCT.
- 2.1 Document D1 discloses (the references in parentheses applying to this document): a data processing method (claim 9), comprising the steps of receiving portions of code of a first type and/or data from a stream, wherein the set of portions transmitted in said stream embodies one or more data processing applications (paragraphs [0010], [0021], figure 1), storing predetermined ones of said portions in a storage means (paragraph [0010]), compiling in a translation engine at least one of said portions comprising first type code into native code of an execution engine, the compiled portions being selected by a control information (paragraphs [0010], [0013], [0023]-[0026]), in the execution engine carrying out one of said data processing applications by executing the compiled native code of the selected portions belonging to said one application and by interpreting non-selected portions of this application (paragraphs [0006], [0007], [0013], [0014], [0021]-[0026]).

The subject-matter of claim 10 therefore differs from document D1 in that:

- the portions of code of a first type and/or data are received from a broadcast network and these portions have been repeatedly transmitted;
- the portions to be compiled are selected by a control information received from the stream from which the portions of code of a first type and/or data are received in the loading engine.

Thus the data processing method as disclosed in document D1 is applied to portions of codes and/or data that have been transmitted in a specific manner, namely repeatedly thru a broadcast network. The mere application of the method on codes and/or data transmitted in this specific manner does not involve an inventive step because the method is independent on how the codes and/or data to which it is applied have been transmitted.

International application No.

PCT/EP 03/50265

EXAMINATION REPORT - SEPARATE SHEET

FROM-EPO SISO3 ELECTRONICS & AUDIO-VIDEO

Furthermore, concerning the second difference mentioned above, the same reasoning as in 1.1 is applicable, thereby demonstrating that selecting the portions to be compiled using control information received from the stream from which the portions of code of a first type and/or data are received in the loading engine lacks inventive step.

Therefore the subject-matter of claim 10 does not involve an inventive step.

2.2 A combination of the reasonings in 2.1 and 1.2 shows that the subject-matter of claim 10 does not involve an inventive step when considering document D3.

T12 POTP90 PG11 DEC 2004

Clean set of claims

10, 20

1. A programmable data processing device comprising :

- a loading engine (LE) for receiving portions of code of a first type and/or data from a stream (DC) of a broadcast network in which said portions are repeatedly transmitted,
- a storage means (C) for storing the portions received by the loading engine,
- an execution engine (EE) for executing an application embodied by the reeived portions,
- a translating engine (TE) for translating the first type code into a native code of the execution engine (EE)
- characterised in that the translating engine (TE) is adapted to store the thus compiled portion in the storage means (C), to compile at least a certain one of said received portions into native code, these portions being selected by a control information received from the stream (DC), and to interpret other portions of code, and that the execution engine (EE) is adapted to process compiled code and interpreted code within a same application.
- 2. The data processing device according to claim 1, wherein the stream (DC) is a DSM-CC carousel.
- 3. The data processing device according to claim 2, wherein said portion is all or a fraction of a DSM-CC module (I).
- 4. The data processing device according to claim 3, wherein the control information is DSM-CC pre-fetch signalling.
- 5. The data processing device according to claim 3, wherein the translating engine (TE) is adapted to extract the control information from a payload module (T) of the DSM-CC carousel (DC).

AMENDED SHEET

20

FROM-EPO SISO3 ELECTRONICS & AUDIO-VIDEO

- The data processing device according to claim 5, wherein the translating engine (TE) is adapted to extract compiling optimization information relating to a portion of code to be compiled from said payload module (T) and to heed the compiling optimization in the process of compiling said portion of code.
- The data processing device according to one of claims 1 to 6, wherein the translating engine (TE) is adapted to decide whether to compile or to interpret a given portion of first type code according to control information received from the execution engine (EE).
- The data processing device according to claim 7, wherein the translating engine (TE), during compilation of a given first type code portion, is adapted to ignore control information requiring said portion to be interpreted, and to finish compiling the portion.
- The data processing device according to claim 8, wherein the translating engine (TE), when receiving control information requiring a given first type code portion to be interpreted during compilation of said portion, is adapted to abandon the compilation and to start interpreting the portion.
- of: 10. A data processing method. comprising the steps receiving (a1, a1') portions of code (I) of a first type and/ or data (D) from a - a) stream (DC) of a broadcast network in which said portions (I, D) are repeatedly transmitted, wherein the set of portions transmitted in said stream (DC) embodies one or more data processing applications
- b) storing (a6, a9', b3) predetermined ones of said portions in a storage means (C),
- c) compiling in a translation engine at least one of said portions comprising first type code into native code of an execution engine, the compiled portions being selected by a control information received from the stream (DC),
- d) in the execution engine (EE), carrying out one of said data processing applications by executing (c6) the compiled native code (N) of the selected portions belonging to said one application and by interpreting (c7) non-selected portions of this application.

MEP 03302

- 11. The data processing method of claim 10, comprising, between steps c and d, the step of receiving an instruction from a user specifying the application to be carried out in step d.
- 12. The data processing method according to claims 10 or 11, wherein the stream (DC) is a DSM-CC carousel.
- 13. The data processing method according to claim 12, wherein said portion is all or a fraction of a DSM-CC module.
- 14. The data processing method according to claim 13, wherein the control information is DSM-CC pre-fetch information.
- 15. The data processing method according to claim 13, wherein the control information is a payload module (T) of the DSM-CC carousel (DC).
- 16. The data processing method of claim 15 wherein the control information further comprises compiling optimization information relating to a portion of code to be compiled, and the translation engine heeds the compiling optimization information when compiling said portion of code.
- 17. The data processing method according to one of claims claim 10 to 13, wherein the translating engine (TE) decides based on said control information from the execution engine (EE) whether to compile or to interpret a given first type code portion.
- 18. The data processing method according to claim 17, wherein if the translation engine (TE) receives control information requiring a given portion to be interpreted during compilation of said portion, it ignores (c11) the control information and finishes compiling the portion.
- 19. The data processing method according to claim 17, wherein if the translation engine (TE) receives control information requiring a given portion to be

22

interpreted during compilation of said portion, it abandons the compilation (c11') and starts interpreting the portion.

20. The data processing method according one of claims 10 to 19 in which, after step c), memory space allocated to the first type code of the compiled portion is released for overwriting.
